

THE SDI DENTAL CLINIC
A STEP BY STEP FOR INSTALLATION
Q. VOELLINGER, SDI, AUGUST 2006

(updated October 2008)

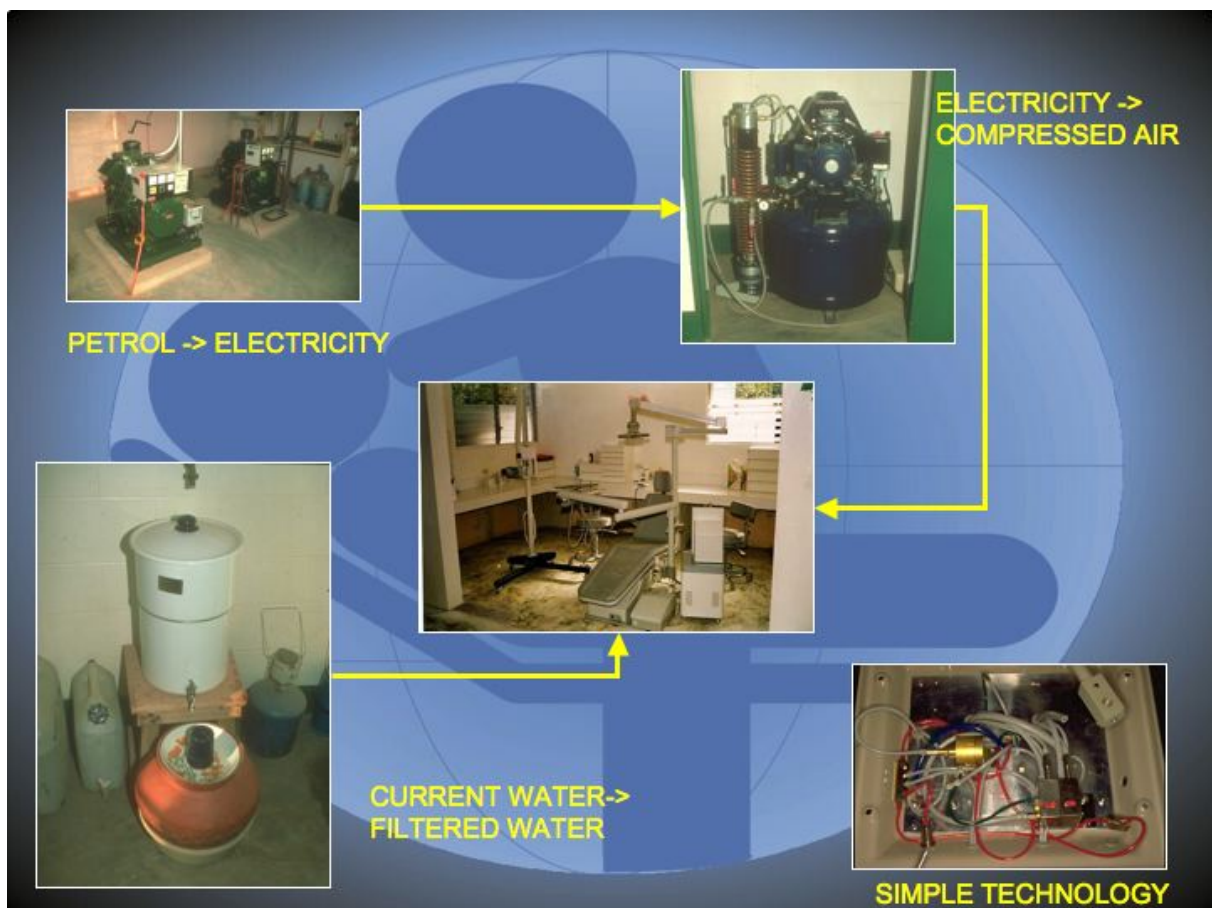

HOW A SDI DENTAL CLINIC IS INSTALLED

1. Step : Draw a plan of the rooms of the future dental clinic. Set the different objects at the right place: technical room, dental unit, treatment materials, X-ray and development, stock, sterilisation, sitting room, reception, toilets. (Principle of SDI : We try to use equipments of simple technology (easily repairable) which are resistant to humidity and sand storms. See explanation on continuation annex 1)
2. Step : Draw the electricity pathways, the fresh water and the used water pathways.
3. Step : Ask for an estimate concerning all the transformations which have to be done.
4. Step : Select the equipment and the dental materials you need. Make a list and make a global evaluation of what it will cost (in 2008 : equipment & dental materials : **€ 41'135.-** without transport, customs taxes , construction and installation). Do not forget the transportation costs and the customs taxes. (See annex 2 for the costs of equipment and dental materials of a standard SDI clinic ready to be used)
5. Step : Set up a general budget (installations, equipment, material, customs, transport, salaries for 3 months, maintenance, rent, etc) and **add 30%** (reserve, unexpected, etc) of the final result to the total amount.
6. Step : Fundraising **until this amount has been reached.**
7. Step : Start transformations and order equipment and materials.
8. Step : Install the dental clinic. Make it run with a good administrative program. (some management tips are given in the SDI documentation)

http://www.secoursdentaire.ch/download/001_documentation_sdi_JJ_MS_1992_en.pdf

ANNEX 1

- A generator is needed to feed the compressor and other dental machines (dental lamp, suction machine, sterilizer, X-Ray, ...)
- The compressor brings compressed air into the dental unit.
- The micromotors of the unit work with compressed air and the water provides from a bottle of PET fixed on the unit.
- Water is first filtered by a KATADYN filter battery before filled into the PET bottle.

CONTINUATION ANNEX 1

The philosophy of SDI in concerns of equipment and materials :

Most of the time, the dental materials are bought for very low prices in Switzerland. These materials are sent per ship and on the roadway. The local clinics are responsible for the reception of these materials. Also, the locals have to deal at the customs to get these materials into the country for a low amount of custom taxes. Volunteer European dentists get on the site to install the equipment and train the local personal for the use of these materials. Most of the materials is new. Used equipment can be sent if it is less than 5 years old and for which we think we will have the possibility to find spare parts during ten more years. Our equipment is essentially deprived of electronics. The fixed dental units for example work on a compressed air basis only. This has for consequence that the cleaning and the replacement of simple plastic tubes is easily done by our African collaborator and this makes them less dependant on repair specialists. What concerns the smaller materials (anaesthetic carpules® for example), we try to buy it locally. This develops and supports the local trade. The dental equipment, the sterilisation, the radiology, the instrumentation, the laboratory machines and the MDU (mobile dental unit) are usually long-lasting apparatuses. However, the African climatic conditions increase the deterioration procedure. In spite of that, the replacement of these apparatuses is not more frequent than in our country.

ANNEX 2

For the equipment only, you can have a look at the following list. Prices are as well indicated. This gives you already an idea of what the bigger objects cost.
